

Monstera deliciosa - care sheet

Light: bright and indirect. A metre or two back from a sunny window is about right.

Water: when the top few centimetres of soil are dry. Not on a schedule.

Feed: a balanced liquid feed once a month in the growing season. Nothing in winter.

Repot: every couple of years, or when roots come out of the bottom of the pot.

Support: a moss pole. It will climb it, slowly, and the leaves get bigger when it does.

Toxicity: mildly toxic to cats and dogs if chewed. Keep it out of reach.

From the EtherPK demo graph. The plant did not sign off on any of this.
